STEEV GTS V4.4 (STEEV GRID EA)

24/7 NON-STOP MOMENTUM TRAILING GRID TRADING ROBOT

Free Forex Tools | Telegram: https://t.me/free_fx_pro

1. Introduction and General Overview

Steev GTS V4.4 (Steev Grid) is a high-precision, fully automated trading robot (Expert Advisor) developed specifically for the MetaTrader 5 (MT5) platform. The algorithm is tuned for continuous 24/7 operation on the highly volatile XAUUSD (Gold) instrument on the M1 (1-minute) timeframe, and it performs equally stably on any other currency pair.

What fundamentally sets the robot apart from traditional grid or martingale systems is that it does not wait for any lagging indicator signals, and it does not increase risk by opening limit orders below when price moves against it. Instead, it maintains a ladder of pending Stop orders at a safe buffer distance from price, and when the market falls it trails these orders down behind price (Trailing Grid).

KEY ADVANTAGE: The robot runs non-stop in 24/7 mode. As soon as one basket (Buy or Sell) closes in profit, the robot immediately opens a new trade in the opposite direction (BUY → SELL → BUY → SELL). This allows it to profit regularly from market moves in both directions.

2. Strategy Essence and the 5-Stage Cycle

The algorithm works on the following 5-stage mathematical model, proven in real trading screenshots:

Stage 1: Initial Entry and Setting Up the Protection Chain

The robot enters the market with the base volume (e.g. 0.03 lot). At the same time, in case the market moves against it, it places a ladder of up to 30 BUY STOP orders (0.01 lot) at a Buffer distance ($2.00) from the current price. The spacing between orders (Step) is set to exactly $0.50 (50 pips).

Stage 2: Dynamic Shift When Price Moves Against (Trailing Down)

If price keeps falling, the robot does NOT open new market trades! The chain of pending BUY STOP orders follows price downward (trailing grid). As a result, no matter how far price drops, no additional load is placed on the deposit and the initial safety is preserved.

Stage 3: Market Bottom (Minimum) and the Chain Pulled to the Lowest Point

When price reaches its lowest point, the BUY STOP orders have been pulled down to the lowest level. For example, if price has dropped to $4170, the very first BUY STOP order stands ready at around $4172.00.

Stage 4: Reversal Impulse and Opening of Profitable Trades

When the market starts to rebound from the bottom (V-reversal), rising price triggers the BUY STOP orders on its way one after another. Since each new trade is opened in the direction of the upward momentum, they go into net profit from the very first seconds!

Stage 5: Full Basket Close (Basket Close & Reset)

When price returns to the initial entry price (or when the total basket profit reaches the set Target Profit), the robot closes all open positions simultaneously and immediately deletes all remaining pending orders. Right after that, the next (SELL) cycle starts.

3. Extended Capability: 30+ Order Chain Capacity

In the new version, the robot's pending order capacity has been increased to more than 30 orders (InpGridOrdersCount = 30).

- **Covering a large distance:** With $0.50 spacing between orders, 30 orders cover a total price range of $15.00 on the Gold market (e.g. from $4170 to $4185).
- **Reliable protection during deep corrections:** Even during strong news or violent volatility on the Gold market, the robot follows price with its 30-order ladder and is able to close the entire chain with a large profit on the way back.

4. Installation and Setup Guide for MetaTrader 5

- **Step 1 — Place the file in the terminal:** Open MT5. From the top menu select File → Open Data Folder. In the window that opens, go to the MQL5 → Experts folder and place the SteevGridEA.mq5 file there.
- **Step 2 — Compile (MetaEditor):** Press F4 to open MetaEditor. In the Navigator list on the left, find Experts → SteevGridEA.mq5 and press the Compile (F7) button at the top. The Log window at the bottom should show 0 errors, 0 warnings.
- **Step 3 — Enable Algo Trading:** Return to MetaTrader 5. Make sure the Algo Trading button on the main toolbar is enabled (green).
- **Step 4 — Attach to the chart:** Open the XAUUSD (Gold) chart and set the timeframe to M1 (1 minute). Drag the robot from the Navigator window onto the chart with the mouse.
- **Step 5 — Grant permission:** In the settings window that appears, go to the Common tab, tick Allow Algo Trading and click OK.

5. Full Table of Robot Settings (Input Parameters)

All settings are presented in English according to the international standard:

Parameter	Default	Description and Instructions
InpMagicNumber	789456	Robot's unique ID, so it does not mix up trades with other robots.
InpStartMode	START_NON_STOP_24_7	24/7 non-stop mode. Runs continuously without waiting for any signal.
InpFirstTradeDir	FIRST_TRADE_BUY	Direction of the very first trade (BUY or SELL).
InpNextCycleMode	CYCLE_ALTERNATING	Alternating mode: when a BUY basket closes it opens SELL, when SELL closes — BUY.
InpBaseLot	0.03	Volume (lot) of the first base entry trade at the start of the cycle.
InpEnableGrid	true	Enables the Dynamic Trailing Grid protection system.
InpGridLot	0.01	Lot size of the chain's pending orders.
InpGridOrdersCount	30	Maximum number of pending orders (up to 30+ levels).
InpGridStep	0.50	Step between orders ($0.50 distance = 50 pips).
InpGridBuffer	2.00	Buffer distance between current price and the 1st order ($2.00).
InpTrailThreshold	0.20	Sensitivity for shifting orders down when price makes a new minimum ($0.20).
InpCloseAtBasePrice	true	Fully close the whole basket when price returns to the first entry price.
InpTargetProfitUSD	100.0	Target profit ($). When the basket reaches this profit, all trades are closed.
InpBasketSL_USD	0.0	Emergency basket Stop Loss (in $). 0 = disabled.
InpShowDashboard	true	Show the visual control panel on the chart.

6. Chart Control Panel (Interactive UI Dashboard)

For user convenience, a fully English interactive information panel is located in the left corner of the chart:

- **Status:** Current state of the robot (ACTIVE (24/7), ACTIVE (In Grid) or PAUSED).
- **Direction:** Current trading direction (BUY (Long) or SELL (Short)).
- **Base Price:** Price of the first trade opened in the cycle.
- **Open Positions:** Number of positions currently open in the market.
- **Pending Orders:** Number of Stop orders not yet triggered.
- **Total Lots:** Total combined volume of all trades currently in the market.
- **Floating PnL:** Real-time floating profit or loss of the current basket (in $, green/red).

Dashboard Buttons

- **[PAUSE / RESUME]:** When pressed, the robot stops opening new cycles (pauses). If the robot currently has open positions, it continues managing them, but will not open a new trade after the basket closes. Pressing the button again (RESUME) resumes 24/7 non-stop trading.
- **[CLOSE ALL]:** When this red button is pressed, all open trades and all pending orders are closed/deleted immediately and the chart returns to a clean state.

7. Risk Management and Recommendations for Successful Trading

Topic	Recommendation
Recommended deposit	Since XAUUSD (Gold) is a highly volatile instrument, the recommended minimum deposit for trading with 0.03 base lot and 0.01 grid lot is $500 – $1,000. If your deposit is $200 – $300, it is recommended to reduce the Base Lot to 0.01.
Using a VPS server	For the robot to run 24/7 non-stop, your computer must always be on, or you should rent an inexpensive VPS (Virtual Private Server) and install MT5 on it. This protects against internet outages or power cuts.
Important news	During releases of very strong fundamental news such as the US Federal Reserve (FED interest rate) or NFP (Non-Farm Payrolls), temporarily pausing the robot with the [PAUSE] button reduces risk.
